 **HYDROFLOW®** | Dynamic viscous fluid units for heel and forefoot enhance midsole cushioning—attenuating shock with industry-leading dampening and comfort.

 **DIAGONAL ROLLBAR (DRB®)** | A high-density post at the medial arch is engineered for pronation control and creates a smoother transition from the midstance phase into the propulsion phase.

 **DRB® ACCEL** | Enhances tunable torsion of the midfoot. Shank-like thermoplastic devices vary from single units of a set modulus, to dual-unit versions of varied modulus (tuned with higher stiffness for medial support, the lateral side less stiff to smooth the ride).

 **S-257 CUSHSOLE** | Durable, energy-efficient midsole compound utilized as an insole board for even more cushioning and flexibility.

OUTSOLE

- HPR Plus
- Forefoot Stable Pod Construction
- Contact Rubber Forefoot

 **HPR PLUS** | A higher durability, abrasion-resistant rubber outsole compound that wears longer.

 **ENGINEERED STABLE POD CONFIGURATION** | Midsole and outsole components are engineered to set the foot up in an efficient, balanced position from heel strike to toe-off, offering maximum stability and responsiveness.
